

Cloud

WebServices 2.0

We've taken the hard work out of integrating your eCommerce website(s) with Khaos Control Cloud. Your web developer simply provides you with URL end-points which you then paste into KC Cloud. Communication with your websites and / or apps is then instant and continuous.

Stock Items URL

Products are uploaded whenever you create or change them.

Stock Levels URL

Inventory figures are uploaded as soon as they change.

Orders URL

We'll call your website / app automatically and pull orders down.

Order Status URL

As you process an order and its status updates we'll tell your website / app.

Cloud

WebServices 2.0

HTTP Requests

Data can be sent or received in the HTTP requests as:

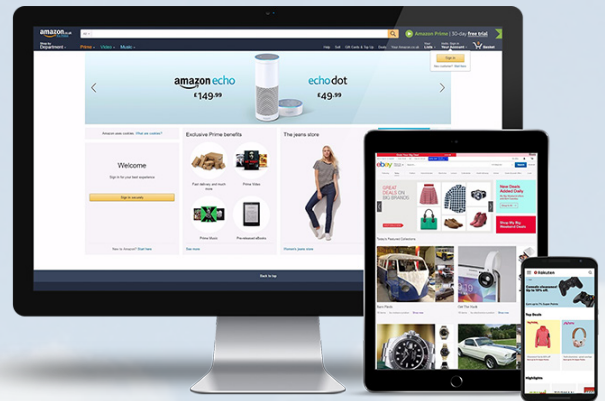

- JSON
- XML
- CSV
- Google Protocol Buffers

Defined By You

URLs can be *anything* and will be defined *by you*. We will package data into the 'Post' parameter of an HTTP request.

Batch & Send

Data is sent in batches for speed and efficiency. For example, stock level changes are batched up uploaded every 10 minutes.

In The Right Hands

Khaos Control Cloud handles and controls when data is sent or requested.

We Recommend

That you and / or your Web Developer point the URLs you create to a REST webservice, created in your preferred language.
